# 1 The Fine Cyclo reducer

## Inner design Series A

## Inner design Series D

**Inner design Series C**

**Inner design Series T**

- ① Cycloid disc
- ② Eccentric high speed shaft
- ③ Input shaft bearing
- ④ Main Bearings
- ⑤ Ring gear (housing)
- ⑥ Radial shaft seal output side
- ⑦ Output flange
- ⑧ Output shaft
- ⑨ Planet gears
- ⑩ Input shaft with helical gear

### 1.1 Operating principle - Series A, D, and C

The gearbox of the Fine Cyclo series is fundamentally different in principle and mechanism from the helical gearing mechanism of competitors' gear motors. The unique reduction gearbox is an ingenious combination of the following two mechanisms:

- A planet gear and a fixed internal sun gear (hollow gear). On the Fine Cyclo the planet gear has cycloidal cam motion (cycloid disc) and the fixed sun gear has a circular arrangement of ring gear pins. The fixed sun gear has one or two "teeth" more than the "planet gear" (cycloid disc).
- A spline for constant speed.

Fig. 1 Principle of the internal planet gearbox

Fig. 2 Epitrochoidal planet gear, circular arrangement of ring gear pins (PIN) combination

Fig. 3 Internal gearing for constant speed

Fig. 4 Planet sun gear combination and internal gearing for constant speed

In equation 1, below, P identifies the number of the planet gear teeth, S that of the sun gear, and  $\omega_2$  the angular velocity of the planet gear around its own axis (see Fig. 1). The speed ratio of  $\omega_2$  to  $\omega_1$  is represented as follows:

$$\text{Equation 1 } \frac{\omega_2}{\omega_1} = 1 - \frac{S}{P} = -\frac{S-P}{P}$$

The highest velocity ratio is obtained with S greater than P by one or two in this equation.

That is to say, if  $S-P=1$  is applied to Equation 1, the velocity ratio may be calculated using the following equation:

$$\text{Equation 2 } \frac{\omega_2}{\omega_1} = -\frac{1}{P}$$

If, on the other hand,  $S-P=2$  is applied to Equation 1, the velocity ratio may be calculated using the following equation:

$$\text{Equation 3 } \frac{\omega_2}{\omega_1} = -\frac{2}{P}$$

As the crankshaft rotates at the angular velocity  $\omega_1$  around the axis of the sun gear, the planet gear also rotates at the angular velocity:

$$-\frac{1\omega_1}{P} \text{ or } -\frac{2\omega_1}{P}$$

P indicates the number of teeth of the planet gear and the symbol indicates that the planet gear rotates in a reverse direction to that of the crankshaft (eccentric).

As shown in Fig. 2, the Fine Cyclo circular teeth (pins) are adapted to the sun gear and the trochoidal teeth to the planet gear, thereby avoiding mutual obstruction of the spline.

The rotation of the planet gear around its own axis is caused by a constant speed internal gearing mechanism as shown (see Fig. 4).

In this mechanism, shown in Fig. 4 the pins of the output shaft are evenly spaced on a circle that is concentric to the axis of the sun gear. The pins transmit the rotation of the planet gear by rolling internally around the circumference of the bores of each planet gear or cycloid disc.

The diameter of the bores minus the diameter of the output shaft pins is equal to twice the eccentricity value of the crankshaft (eccentric).

This mechanism smoothly transmits only the rotation of the planet gear around its own axis to the output shaft.

## 1.2 Operating principle Series T

The Series T gearboxes are double stage and differ from the single stage series in having 3 eccentrics, driven by the input shaft with spur teeth. The cycloid discs are driven via 3 eccentric shafts and not directly by one eccentric input shaft. The pins and the eccentric shafts in the output shaft are evenly spaced on a circle, which is concentric to the axis of the sun gear. The pins transmit the rotation of the planet gear by rolling internally around the circumference of the bores of each planet gear or cycloid disc.

Fig. 5 Double stage gearbox

If the input shaft rotates with a speed  $\omega_1$ , then the angular velocity of the planet gear around its own axis is  $\omega_2$ .  
 If the eccentric shaft rotates with a rotational speed  $\omega_2$  and the hollow gear is fixed, then the angular velocity of the cycloid discs around their own axis is  $\omega_3$ . Z is the number of teeth or the number of curve traces or ring gear pins.

$$\text{Equation 1} \quad \omega_2 = \frac{Z_a}{Z_b} (\omega_3 - \omega_1) + \omega_3$$

$$\text{Equation 2} \quad \omega_3 = \left(1 - \frac{Z_d}{Z_c}\right) \cdot \omega_2$$

Partial reduction ratio when the angular velocity of the eccentric shaft gear around the input shaft is equal to 0:

$$\text{Equation 3} \quad i_1 = \frac{Z_b}{Z_a}$$

Partial reduction ratio of the trochoid gearing:

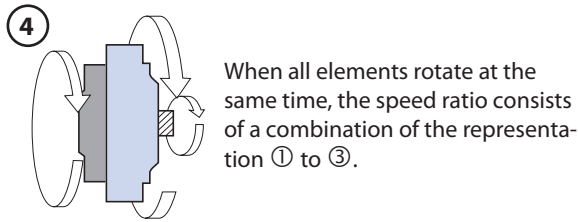

$$\text{Equation 4} \quad i_2 = \frac{Z_c}{(Z_c - Z_d)}$$

$$\text{Equation 5} \quad i = 1 + i_1 \cdot (1 - i_2)$$

$$\text{Total reduction ratio} \quad i = \omega_1 / \omega_3$$

### 1.3 Speed ratio and rotation direction - Series A, D, and C

$n$  = Speed ratio = (output speed/input speed)  
 ("-" indicates the possible opposite direction)

$i$  = reduction ratio

#### Output flange rotates

Catalogue reduction

#### Gearbox housing rotates

Catalogue gear reduction +1

### 1.4 Speed ratio and rotation direction Series T

## 1.5 Features and advantages

### Compact design

The high reduction ratios, in one or a maximum of two stages, allow for extremely compact designs with a long lifetime. Moreover, due to the different versions available, these gearboxes can be optimally integrated into the machine environment.

### Simple installation

The Series A, D, and C gearboxes are lubricated for life, fully sealed and maintenance-free. Convenient and simple motor mounting is also taken account of in all ranges.

### Precise positioning

In more and more applications, fast cycle speeds and precise positioning are required in order to increase the efficiency of machines or to open up new fields of application. The special Cycloid systems of the Fine Cyclos offer high-precision positioning with maximum dynamics.

### Precision gearbox with large hollow shaft bore and high capacity bearing

The Series C gearbox was specifically developed with an extra large hollow shaft bore through which supply lines, shafts, and other media can be passed. The integrated bearing can handle high loads on the output side that could occur while using machine tools, positioning or during robotics applications.

### The right size for every application

The wide range of gearbox series and the numerous sizes available within each series enable the selection of the right gearbox for any precision application.

Gearboxes with outer diameters ranging from 115 mm to 570 mm are available. With these, a range of acceleration torques from below 100 Nm up to 30,000 Nm can be covered.

In the event of an emergency stop, this precision gearbox can even be safely subjected to a load of 60,000 Nm.

### High torsional stiffness and low moments of inertia

For these application areas, Sumitomo Drive Technologies has developed a highly accurate series of backlash-free precision gearboxes. Compared with conventional gearboxes, the construction principle offers the highest torsional stiffness as well as low moments of inertia - ideal for highly dynamic tasks.

## 1.6 Application Examples

Axle drive for industrial robot

Pallet changer drive

Welding positioner

Machine tool  
Automatic pallet pool input

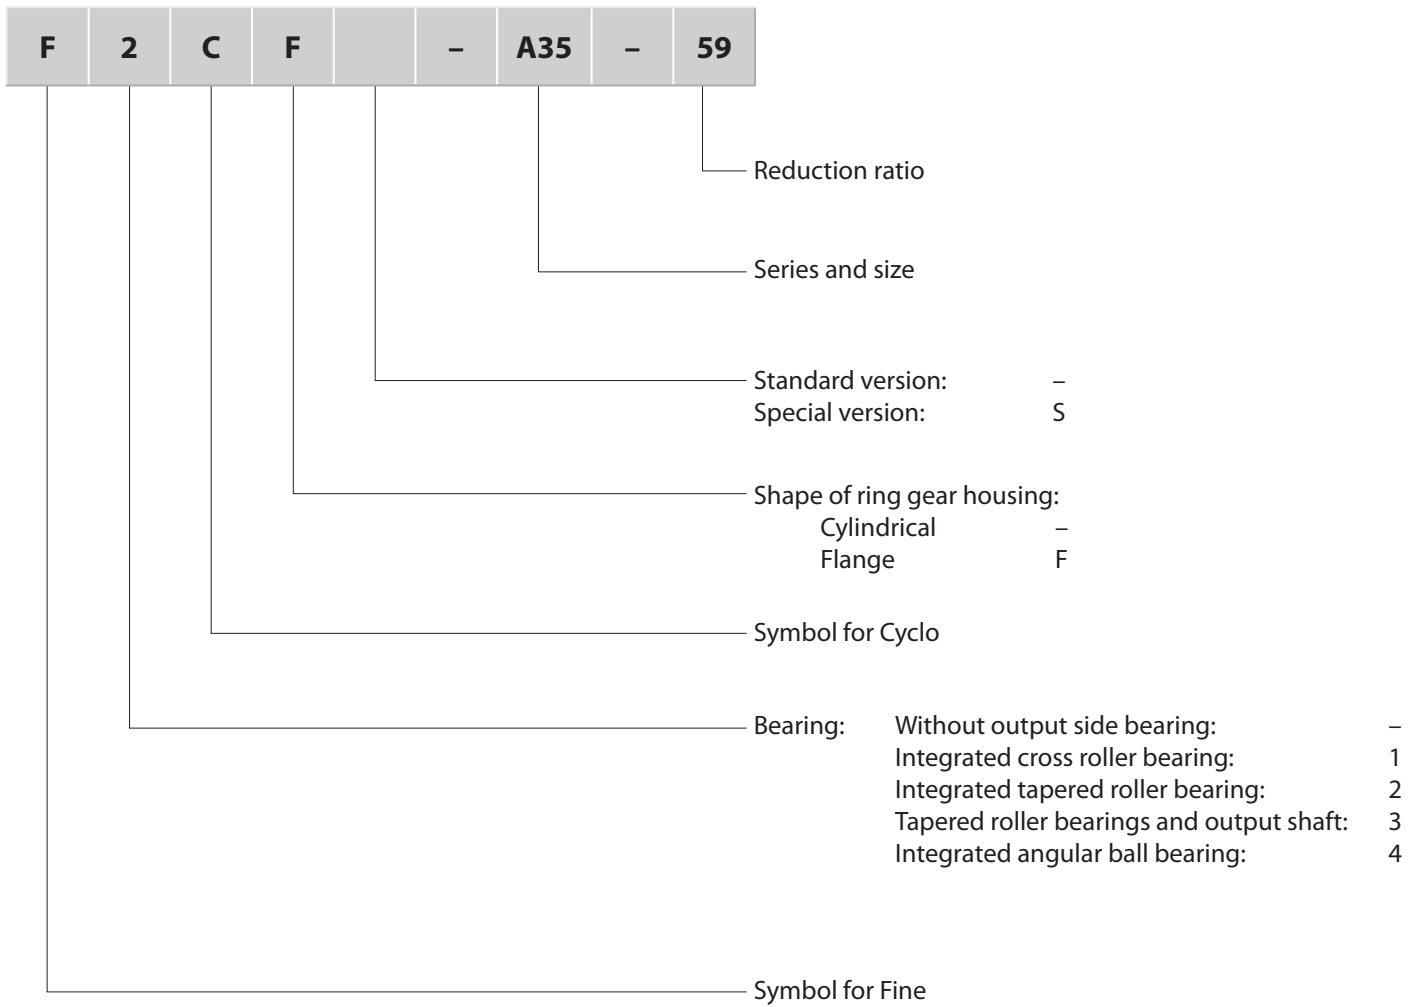

Palletising robot

Liquid crystal transfer robot

## 2 Nomenclature

### 3 Gearbox selection

#### 3.1 Reduction ratio and acceleration torque

#### 3.2 Max. bending moment on the output flange

#### 3.3 Max. hollow shaft diameter

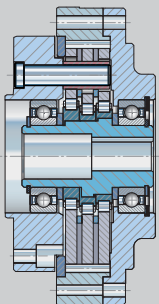

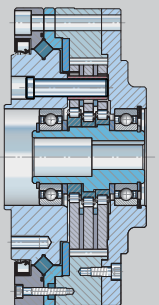

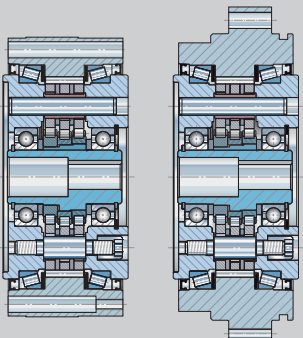

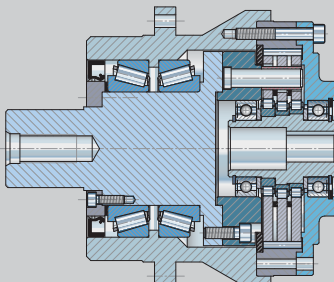

### 3.4 Reduction ratio and outer diameter

#### A-Series

**Special feature:** Both a reduction kit without an output side bearing as well as fully sealed versions and a gearbox with output shaft instead of output flange are available

**Optional:** Available with motor adapter, customer-specific input shaft or output flange and other modifications

### 3.6 Flow chart and equation of selection

Sumitomo Drive Technologies would be happy to take over the selection and calculation process for you. Please refer to the application data sheet in the appendix.

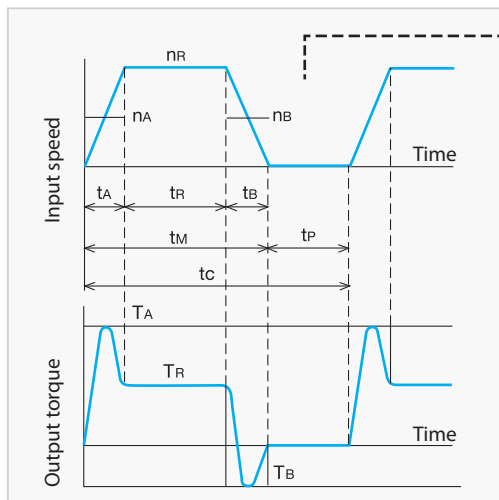

Fig. 6 Load cycle

$n_{1A}$  : Mean input speed during acceleration [ $\text{min}^{-1}$ ]  
as per Fig. 6  $n_{1A} = \frac{n_{1R}}{2}$

$n_{1R}$  : Input speed during uniform movement [ $\text{min}^{-1}$ ]

$n_{1B}$  : Mean Input speed during braking [ $\text{min}^{-1}$ ]  
as per Fig. 6  $n_{1B} = \frac{n_{1R}}{2}$

$n_{1m}$  : Mean input speed [ $\text{min}^{-1}$ ]

$t$  : Time [sec.]

$t_A$  : Run-up time [sec.]

$t_R$  : Duration of uniform movement [sec.]

$t_B$  : Braking time [sec.]

$t_M$  : Duration of the movement phase of a working cycle [sec.]

$t_P$  : Duration of pause [sec.]

$t_C$  : Duration of one working cycle [sec.]

$T_{2A}$  : Output side acceleration torque [Nm]

$T_{2R}$  : Output torque at constant speed [Nm]

$T_{2B}$  : Output side braking torque [Nm]

$T_{2V}$  : Equivalent output torque [Nm]

$T_{2N}$  : Nominal output torque [Nm]

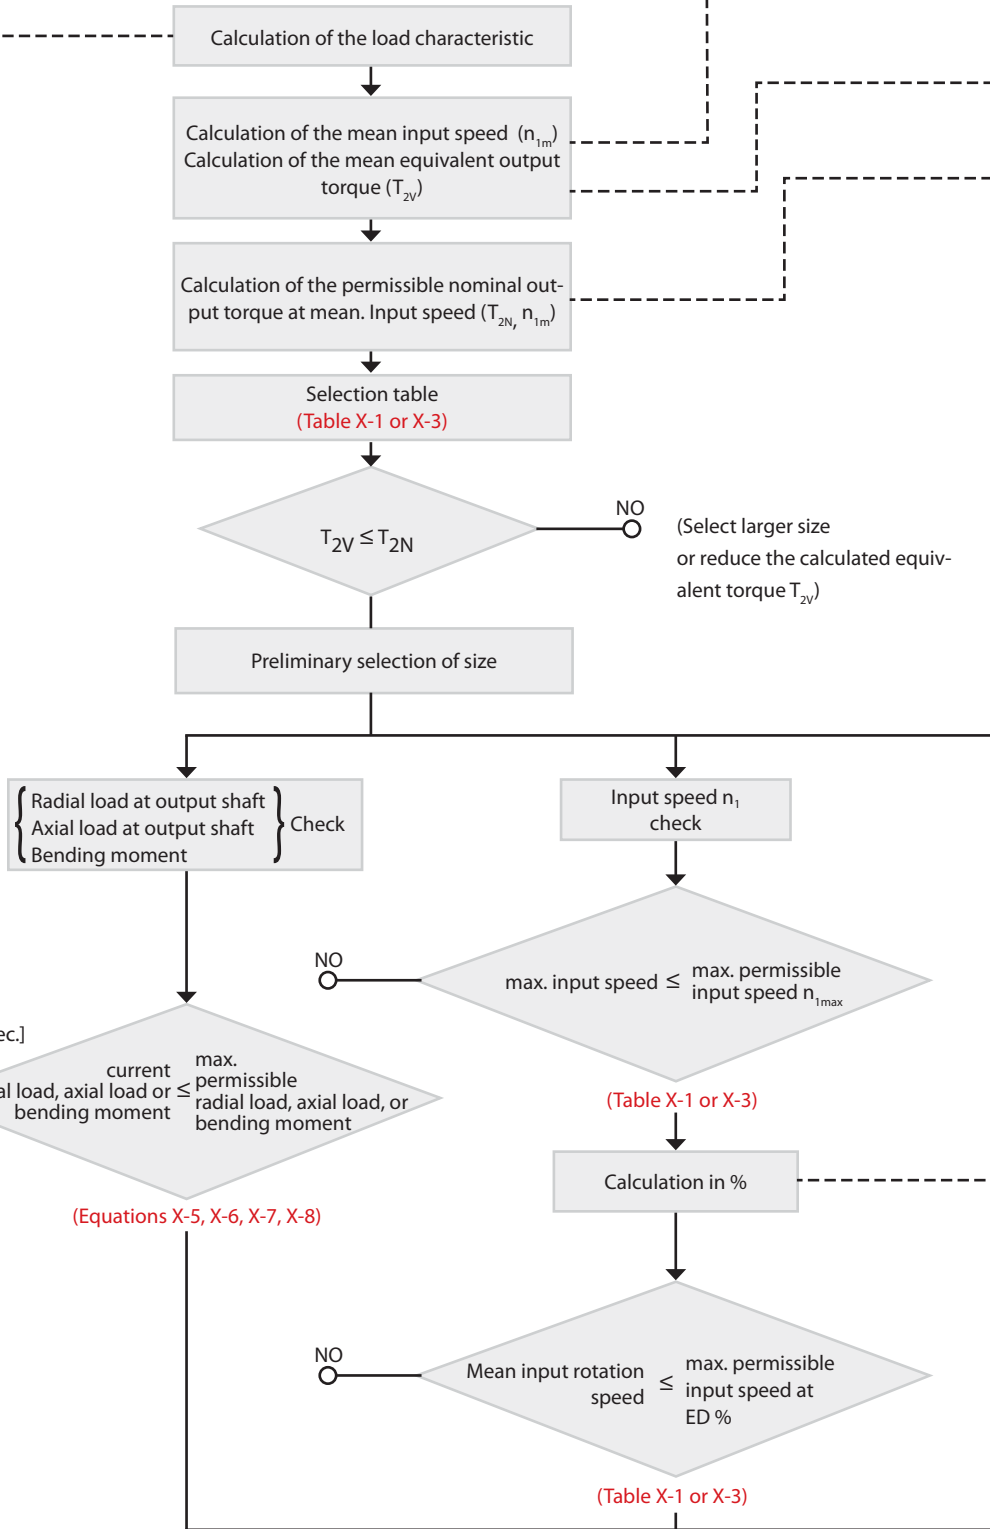

$T_{2Nmax}$  : Maximum permissible nominal output torque [Nm]

$T_{2N600}$  : Nominal output torque at  $n_1 = 600 \text{ min}^{-1}$  [Nm]

$B_{f2}$  : Service factor output

ED: Load time ratio %

The tables and equations relating to the references marked red are located in the respective sections covering the series (A, D, C, and T):

	Page number			
	A	D	C	T
Table X-1	p. 24	p. 60	p. 78	p. 96
Table X-2	p. 26	p. 62	p. 80	p. 98
Table X-3	p. 26	p. 62	p. 80	p. 98

	Page number			
	A	D	C	T
Equation X-1	p. 31	p. 67	p. 85	-
Equation X-5	from p. 33	p. 69	p. 87	p. 103
Equation X-6,7	from p. 33	p. 69	p. 87	p. 103
Equation X-8	from p. 33	p. 69	p. 87	p. 103

Calculation in load condition as per Fig. 6

○ Mean input speed  $n_{1m} = \left( \frac{t_A \cdot n_{1A} + t_R \cdot n_{1R} + t_B \cdot n_{1B}}{t_M} \right)$  (Equation - 8)

○ Mean equivalent output torque  $T_{2V} = \left( \frac{t_A \cdot n_{1A} \cdot T_{2A}^3 + t_R \cdot n_{1R} \cdot T_{2R}^3 + t_B \cdot n_{1B} \cdot T_{2B}^3}{t_M \cdot n_{1m}} \right)^{1/3} \cdot B_{f2}$  (Equation - 9)

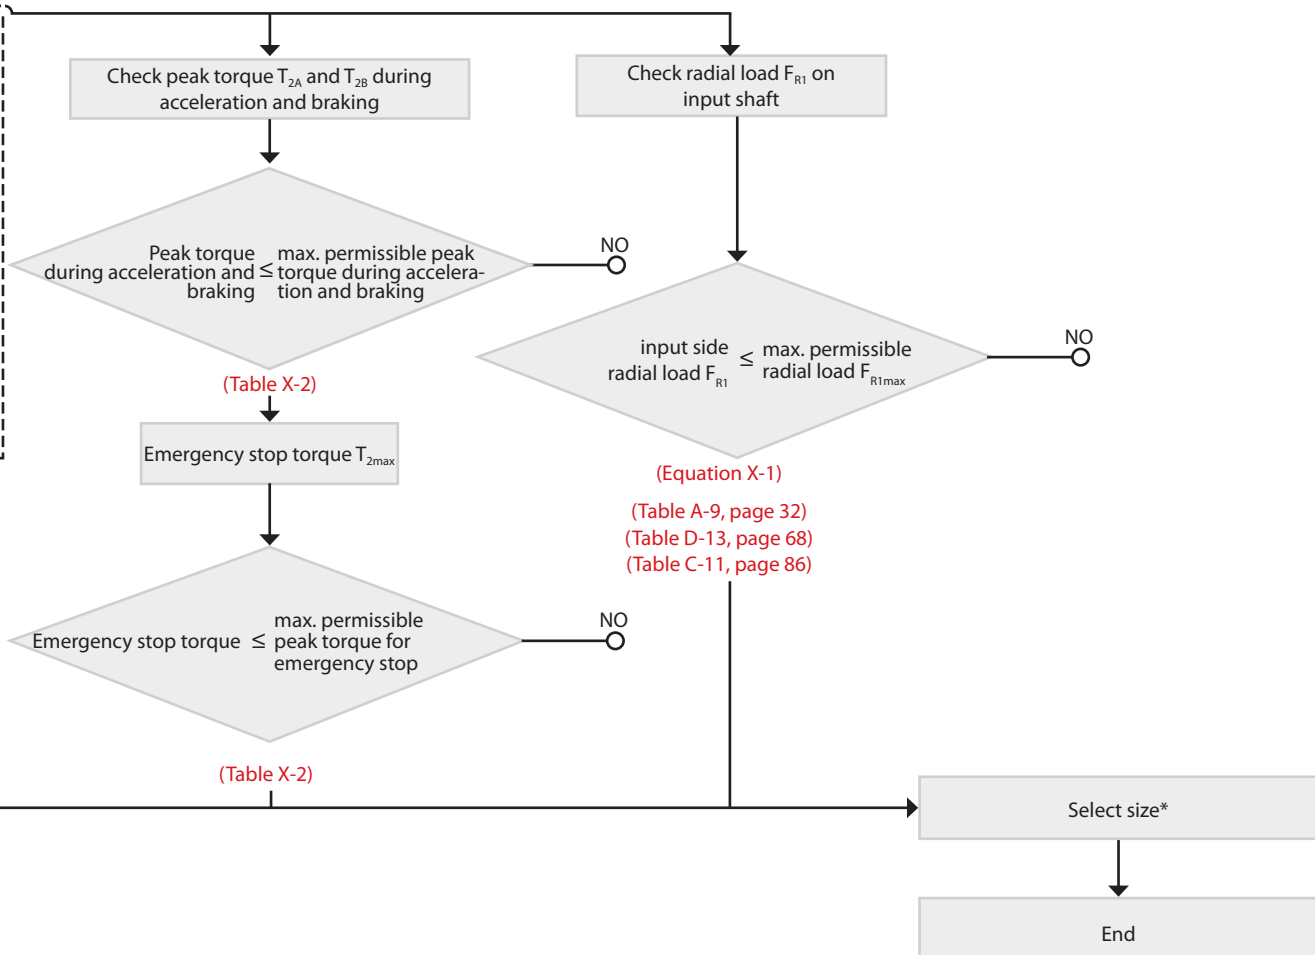

○ Max. permissible nominal output torque at mean input speed  $T_{2Nmax} = T_{2N,600} \cdot \left( \frac{600}{n_{1m}} \right)^{0.3}$  (Equation -10)

○ ED %  $ED \% = \left( \frac{t_m}{t_c} \right) \cdot 100 [\%] = \left( \frac{t_c - t_p}{t_c} \right) \cdot 100 [\%]$  (Equation -11)

$T_{2N,600}$ : Nominal output torque at an input speed of 600 min<sup>-1</sup> (Table X-3)

Please note the instructions on load duty cycles in chapter 4.

If  $n_{1m} < 600 \text{ min}^{-1}$ , the value in the table at input speed of 600 min<sup>-1</sup> applies for  $T_{2N}$

\* When selecting the motor, the input side breakaway torque (BTI) or no-load running torque (NLRT) must be taken into account.

### 3.6.1 Selection example

Calculation example for Type F4C-C25-119 for the following specification:

$T_{2A}$	= output side acceleration torque	600 Nm
$T_{2R}$	= output torque at constant speed	250 Nm
$T_{2B}$	= output side braking torque	400 Nm
$T_{2max}$	= emergency stop torque	1700 Nm (1000 x over the entire lifetime)
$n_{1A}$	= mean input speed during acceleration	1250 min <sup>-1</sup>
$n_{1R}$	= input speed during uniform movement	2500 min <sup>-1</sup>
$n_{1B}$	= mean input speed during braking	1250 min <sup>-1</sup>
$t_A$	= start-up time	0.3 sec
$t_R$	= duration of uniform movement	3.0 sec
$t_B$	= braking time	0.3 sec
$t_m$	= duration of the movement phase of a working cycle	3.6 sec
$t_p$	= duration of pause	3.6 sec
$t_c$	= duration of one working cycle	7.2 sec
$F_{R1}$	= radial load on input shaft	Driven by toothed belt , minor shocks, $F_{R1} = 196$ N, with force application point 25 mm
$F_{R2}$	= radial load on the output shaft	Connection with pinion, minor shocks, $F_{R2} = 4116$ N, 55 mm from the side of the flange

As this gearbox is to be used to operate a robot joint under uniform load the service factor  $B_{F1}$  should be = 1 (refer to table C-14, page 86, for service factor output ( $B_F$ )).

Mean input speed  $n_{1m} = \left( \frac{0.3 \cdot 1250 + 3.0 \cdot 2500 + 0.3 \cdot 1250}{3.6} \right) = 2292 \text{ min}^{-1}$

Mean equivalent output torque  $T_{2V} = \left( \frac{0.3 \cdot 1250 \cdot 600^3 + 3.0 \cdot 2500 \cdot 250^3 + 0.3 \cdot 1250 \cdot 400^3}{3.6 \cdot 2292} \right)^{1/3} \cdot 1 = 300 \text{ Nm}$

Max. permissible output torque at mean input speed  $T_{2Nmax} = 568 \cdot \left( \frac{600}{2292} \right)^{0.3} = 380 \text{ Nm} \geq 300 \text{ Nm} \Rightarrow$  Type **F4C-C25-119**

Calculation of ED %  $ED \% = \left( \frac{3.6}{7.2} \right) \cdot 100 = 50\%$

○ Checking the maximum input speed  $n_1 = 2500 \text{ min}^{-1} < n_{1 \text{ max}} = 3500 \text{ min}^{-1}$  (Table C-1)

○ Checking the mean input speed  $n_{1m} = 2292 \text{ min}^{-1}$  at 50% ED  $< n_{1m \text{ max}} = 2900 \text{ min}^{-1}$  at 50% ED (Table C-1)

○ Checking the peak torque during acceleration and braking  $T_{2A} = 600 \text{ Nm} < 1030 \text{ Nm}$  (Table C-2)

○ Checking the emergency stop torque  $T_{2 \text{ max}} = 1700 \text{ Nm} < 2060 \text{ Nm}$  (Table C-2)

○ Max. permissible radial load on input shaft when taking correction factors into account

$$F_{R1 \text{ max}} = F_{R1, 600} \times \left( \frac{600}{n_{1m}} \right)^{1/3} = 841 \cdot \left( \frac{600}{2292} \right)^{1/3} = 538 \text{ N}$$

$$F_{R1} = \frac{F_{R1 \text{ max}}}{L_{f1} \cdot C_{f1} \cdot B_{f1}} = \frac{538}{1.14 \cdot 1.25 \cdot 1.2} = 315 \text{ N} > 196 \text{ N}$$

(Table C-11, Equation C-1, see p. 77 et seq.)

○ Checking the max. permissible bending moment  $T_k$

$$l_r = x - a + l_1 = 55 - 43.2 + 162 = 173.8 \text{ mm}$$

Calculated dimension for bending moment  $l_r$

○ Correction factors are used to calculate the external bending moment

$$C_{f2} = 1.25; B_{f2} = 1.0$$

$$T_k = C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot l_r < T_{k \text{ max}}$$

$$T_{ke} = 1.25 \cdot 1.0 \cdot 4116 \cdot 173.8 \cdot 10^{-3}$$

$$T_{ke} = 891 \text{ Nm} < 1850 \text{ Nm}$$

### Selection/result

⇒ Type **F4C-C25-119** was selected by using the above evaluation.

## 4 Explaining the technical details

### Rigidity and Lost Motion

If a torque is introduced in the output shaft when the input shaft is stationary, the relation between the distortion angle and the torque can be read off on the following hysteresis curve (Fig. 7).

Fig. 7 Hysteresis curve

Lost Motion: Distortion angle at 3% of nominal torque.

Rigidity: Inclination of a straight line connecting two points on the hysteresis curve.  
 The table value indicates the average torsional stiffness as a function of the nominal output torque.

**Note** arcmin means "angular minute"

$$1 \text{ arcmin} = \frac{1^\circ}{60}$$

### No-load running torque

No-load running torque must be applied to keep the gearbox in motion without load on the output. The information in the catalogue refers to average values which occur after the gearbox has been run in.

### Breakaway torque

Specifies the torque which is necessary to "break loose" the load-free gearbox from standstill, i.e. to start a rotational movement. This can be done on both the input (BTI) and the output side (BTO).

### Efficiency

Efficiency varies according to speed, load torque, grease temperature, reduction ratio, gearbox size etc.

The dependence between efficiency and input speed is shown in the figures relevant to the respective series, under measurement conditions with permissible output torque and stable grease temperature.

Variations in models and different reduction ratios are taken into account in the efficiency curve.

### Transmission error

The transmission error indicates the deviation of the actual rotation angle of the gearbox from the theoretical value. A defined input-side rotation of the gearbox divided by the reduction ratio gives the theoretical position of the output. The actual angle of rotation varies with a deviation of some angular seconds around this value.

Fig. 8 Typical transmission error

**Note** arcsec means "angular second"  
 $1 \text{ arcsec} = \frac{1^\circ}{3600}$

Applications for precision gearboxes generally differentiate between positioning and smooth traverse applications.

For positioning applications only the standstill positions of the gearbox play a role (e.g.- tool magazine). Here, the transmission error is usually not important.

For smooth traverse applications, precision is important at every moment of movement (e.g. continuously welding robots). Here, a major transmission error can lead to unsatisfactory results.

Fine Cyclo reducers are ideally suited for both applications. Both single stage and double stage gearboxes show only minimal transmission error. If maximum path accuracy is required, Fine Cyclo double stage reducers provide additional advantages. Please contact Sumitomo Drive Technologies for assistance in choosing the correct gearbox.

### Load cycle

The load cycle ( $t_c$ ) reflects the sequence of movements in the application used. This typically consists of at least one acceleration phase ( $t_A$ ), one constant speed phase ( $t_R$ ), one deceleration ( $t_B$ ), and one pause of movement ( $t_P$ ).

## Load duty cycle

The load duty cycle time is the percentage duration of the movement phase in proportion to the duration of the working cycle within a periodically repeating load cycle. In particular, the speed and load duty cycle, as well as the torque and the installation situation (e.g. convection or external heat influence) determine the temperature development in the gearbox. Continuous operation of the gearbox at high speeds, or load duty cycles, would lead to overheating and eventual destruction of the gearbox. To avoid this, the temperature of the gearbox housing during operation should not exceed 70°C.

Therefore, a few basic principles must be taken into account.

For F\_C-A; D; C:

The basis of measurement is intermittent operation (S5 operation) with a maximum running time ( $t_c$ ) of 10 minutes, which includes an off-time. This means that it is necessary to check the allowed mean input speed  $n_{1m}$  according to the permitted nominal speed for %ED ( $n_{1m} < n_{1ED}$ ). For load duty cycles of less than 50%, we recommend using 50%ED nominal speeds, and for those greater than 50%, 100%ED nominal speeds, for checking  $n_{1m}$ .

For F2C-T:

The basis of measurement for F2C-T is the maximum output speed ( $n_{2max}$ ), which corresponds simultaneously to the limit speed that is allowed in continuous operation (100%ED). It is therefore necessary to check the maximum occurring speed  $n_{2max}$  in the movement cycle against the limiting speed  $n_{2max}$ . The need to check a permissible nominal speed according to the duty cycle (%ED) is not required here.

Also:

If the duration of the movement phase of the working cycle  $t_M$  is greater than 10 minutes, in the case of continuous operation (S1) or if complex load cycles are performed, please consult Sumitomo Drive Technologies.

## 5 A-Series

### FC-A

#### Special feature:

Customers can use their own bearings, hollow shaft possible, compact reduction kit

- 6 sizes
- Reduction ratios (single stage)  
29/59/89/119/179
- Can be customised to fit individual designs
- Smaller installation space
- Nominal output torques up to 5140 Nm
- Acceleration torques up to 7610 Nm
- Input speeds up to 6150 min<sup>-1</sup>
- Lost Motion < 2 arcmin (optional Lost Motion < 1 arcmin)

### F1C-A

#### Special feature:

High rigidity, compact design

- 6 sizes
- Reduction ratios (single stage)  
29/59/89/119/179
- Nominal output torques up to 5140 Nm
- Acceleration torques up to 7610 Nm
- Input speeds up to 6150 min<sup>-1</sup>
- Lost Motion < 2 arcmin (optional Lost Motion < 1 arcmin)

**F2C-A****Special feature:**

Low noise, high rigidity, compact design

- 4 sizes
- Reduction ratios (single stage)  
29/59/89/119/179
- Tapered roller bearings with high permissible tilting moments
- Nominal output torques up to 1830 Nm
- Acceleration torques up to 2910 Nm
- Input speeds up to 6150 min<sup>-1</sup>
- Lost Motion < 2 arcmin  
(optional Lost Motion < 1 arcmin)

**F3C-A****Special feature:**

Allows high radial forces

- 6 sizes
- Reduction ratios (single stage)  
29/59/89/119/179
- Nominal output torques up to 5140 Nm
- Acceleration torques up to 7610 Nm
- Input speeds up to 6150 min<sup>-1</sup>
- Lost Motion < 2 arcmin  
(optional Lost Motion < 1 arcmin)

: 50% ED range

: 100% ED range (but max. 10 min. without pause)

- $T_{2N}$  = nominal output torque  
Nominal output torque corresponds to the max. permissible average load torque at all output speeds.  
The nominal output torque for speeds less than 5 min<sup>-1</sup> is equal to the value at 5 min<sup>-1</sup>.  
The value for the maximum permissible input power is calculated from the nominal output torque at 100%.  
This value takes the efficiency of Fine Cyclo into consideration.
- $n_{1,max}$  = maximum permissible input speed  
However, it must be  $n_{1,m}$  (mean input speed) <  $n_{1,ED}$ .
- $n_{1,ED}$  = permissible input speed according to load duty cycles
- $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)  
Permissible peak torque for normal start and stop procedures.
- $T_{2max}$  = max. permissible torque for emergency stop situations or in the event of heavy shocks (limited by the mechanical strength)  
(permissible 1000 times during the entire lifetime).
- The nominal torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N,5} \left( \frac{5}{n_{2m}} \right)^{0.3}$$

$T_{2N}$  : Nominal torque at output speed  $n_{2m}$   
 $T_{2N,5}$  : Nominal torque at output speed  $n_{2m}$  is 5 min<sup>-1</sup>

: 50% ED range

: 100% ED range (but max. 10 min. without pause)

- $T_{2N}$  = nominal output torque  
Nominal output torque corresponds to the max. permissible average load torque at all input speeds.  
The nominal output torque for speeds less than 600 min<sup>-1</sup> is equal to the value at 600 min<sup>-1</sup>.  
The value for the maximum permissible input power is calculated from the nominal output torque at 100%.  
This value takes the efficiency of Fine Cyclo into consideration.
- $n_{1,max}$  = maximum permissible input speed  
However, it must be  $n_{1m}$  (mean input speed) <  $n_{1,ED}$ .
- $n_{1,ED}$  = permissible input speed according to load duty cycles
- $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)  
Permissible peak torque for normal start and stop procedures.
- $T_{2max}$  = max. permissible torque for emergency stop situations or in the event of heavy shocks (limited by the mechanical strength) (permissible 1000 times during the entire lifetime).
- The nominal torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N,600} \left( \frac{600}{n_{1m}} \right)^{0.3}$$

$T_{2N}$  : Rated torque at input speed  $n_{1m}$   
 $T_{2N,600}$  : Rated torque at input speed  $n_{1m}$  is 600 min<sup>-1</sup>

Table A-5 Torsional stiffness

(...) Values in brackets apply for F3C-A

$T_p$ : Test torque at input speed  $n_1 = 1500 \text{ min}^{-1}$

#### Calculation of the twist angle:

1) At a load torque less than 3%  $T_p$

$$\varphi = \frac{\text{Lost Motion}}{2} \cdot \frac{\text{Load torque}}{0.03 \cdot T_p}$$

2) At a load torque greater than 3%  $T_p$  (standard case)

$$\varphi = \frac{\text{Lost Motion}}{2} + \frac{\text{Load torque} - (0.03 \cdot T_p)}{\text{Torsional stiffness}}$$

**Note** arcmin means "angular minute".  
Table values for rigidity are average values.

### 5.4 No-load running torque NLRT

No-load running torque for  $i = 59, 89, \text{ and } 119$

Fig. A-1 Input side no-load running torque ( $i = 59-119$ )

No-load running torque for  $i = 29$

Fig. A-2 Input side no-load running torque ( $i = 29$ )

- Note**
1. Fig. A-1 and Fig. A-2 show the average no-load-running torques after gearbox is run in (not factory-new condition)
  2. Table A-6 shows the measuring conditions

### 5.5 Breakaway torque

Breakaway torque on output side (BTO)

- Note**
1. Table A-7 shows the max. breakaway torque on the output side BTO. Fine Cyclo reducers are not self-locking. The BTO is defined as the maximum value (factory-new condition), which steadily decreases during the lifetime.
  2. Table A-6 shows the measuring conditions

Ring gear housing temperature	approx. 30°C
Precision during assembly	as per chapter 5.9.1, 5.10.1, 5.11.1, 5.12.1
Lubrication	Standard lubrication

A75	119	< 4.5

Table A-8 Value of the breakaway torque on the input side (BTI)

**5.6 Efficiency**

Fig. A-3 Efficiency curve

Fig. A-3 shows the correlation between efficiency and input speed. For further information see "4 Explaining the technical details" on page 18.

**Note**

1. The efficiency changes if the load torque does not match the nominal torque. Check the compensation factor in the diagram Fig. A-4.
2. When the torque ratio is over 1.0, the compensation factor for efficiency is 1.0 (diagram Fig. A-4).

Fig. A-4 Compensation curve for efficiency

$$* \text{ Torque ratio} = \frac{\text{Load torque}}{\text{Nominal output torque}}$$

$$\text{Compensation efficiency} = \text{efficiency} \cdot \text{compensation factor}$$

## 5.7 Bearing loads

### 5.7.1 Maximum permissible radial and axial load on the input shaft

Fig. A-5 Load position on input shaft

If a pinion or toothed belt pulley is mounted on the input shaft, the values for radial load and axial load should be equal to or less than the permissible values. The following equation is used to check whether the shaft load is permissible:

1. Input radial load  $F_{R1}$

$$F_{R1} = 10^3 \cdot \frac{T_{2V}}{\eta \cdot i \cdot r_0} \leq \frac{F_{R1 \max}}{L_{f1} \cdot C_{f1} \cdot B_{f1}} \quad [\text{N}] \quad (\text{Equation A-1})$$

2. Input side axial load  $F_{A1}$

$$F_{A1} \leq \frac{F_{A1 \max}}{C_{f1} \cdot B_{f1}} \quad [\text{N}] \quad (\text{Equation A-2})$$

3. When radial and axial loads co-exist

$$\left( \frac{F_{R1} \cdot L_{f1}}{F_{R1 \max}} + \frac{F_{A1}}{F_{A1 \max}} \right) \cdot C_{f1} \cdot B_{f1} \leq 1 \quad (\text{Equation A-3})$$

- $F_{R1}$  = input side radial load [N]
- $T_{2V}$  = equivalent output torque on output shaft [Nm]
- $r_0$  = pitch circle radius of sprocket, pinion or toothed belt pulley [mm]
- $F_{R1 \max}$  = max. permissible input side radial load [N] (Table A-9)
- $F_{A1}$  = input side axial load [N]
- $F_{A1 \max}$  = max. permissible input side axial load [N] (Table A-10)
- $L_{f1}$  = load factor input (Table A-11)
- $C_{f1}$  = correction factor input (Table A-12)
- $B_{f1}$  = service factor input (Table A-13)
- $L$  = distance of radial load from front end on input side of the input shaft [mm] (Table A-11)
- $\eta$  = 0.8 (efficiency)

Size	Input speed $n_{1m}$ [min <sup>-1</sup> ]								
	4000	3000	2500	2000	1750	1500	1000	750	600

### 5.7.2 Main bearings

#### Fine Cyclo - F1C-A

Fig. A-6 Load position output

	Load factor	
	Radial load $X_L$	Axial load $Y_L$
$\frac{F_{A2}}{F_{R2} + \frac{2 \cdot 10^3 \cdot T_k}{d_k}} \leq 1.5$	1	0.45
$\frac{F_{A2}}{F_{R2} + \frac{2 \cdot 10^3 \cdot T_k}{d_k}} > 1.5$	0.67	0.67

- $F_{A2}$  = output side axial load [N]
- $F_{R2}$  = output side radial load [N]
- $C_{f2}$  = correction factor output
- $B_{f2}$  = service factor output
- $d_k$  = mean bearing diameter [mm]
- $T_{k \max}$  = maximum permissible bending moment [Nm]
- $T_k$  = bending moment [Nm]
- $\varphi_1$  = tilt angle [arcmin]
- $\Theta_1$  = moment stiffness main bearing [Nm/arcmin]
- $T_{2v}$  = equivalent output torque [Nm]
- $d_0$  = pitch circle diameter of output element [mm]
- $C$  = dynamic load rating
- $C_0$  = static load rating

For power transmission by pinion, toothed belt, or similar:

$$F_{R2} = C_{f2} \cdot B_{f2} \cdot \frac{2 \cdot 10^3 \cdot T_{2v}}{d_0} \quad \text{(Equation A-9)}$$

Size	$\Theta_1$ [Nm/arcmin]	$T_{k \max}$ [Nm]	$d_k$ [mm]	$C$ [N]	$C_0$ [N]
A15	205	460	101	26700	25400

A75	15600	14400	340	263000	510000

Table A-14 Specification cross roller bearings

#### 1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the output flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad \text{(Equation A-5)}$$

Correction factor	$C_{f2}$
Chain	1
Pinion or rack	1.25
Toothed belt	1.25
V-Belt	1.5

Table A-15 Correction factor output  $C_{f2}$

Service factor	$B_{f2}$
Uniform load	1
Light impacts	1.2
Severe impacts	1.6

Table A-16 Service factor output  $B_{f2}$

A dynamically equivalent load P on the bearing is calculated from these loads.

With the equivalent load P and the mean input speed  $n_{2m}$ , it is possible to test whether the output bearing achieves the desired lifetime  $L_{h10}$ .

$$P = X_L \left( F_{R2} + \frac{2 \cdot 10^3 \cdot T_k}{d_k} \right) + Y_L \cdot F_{A2} \quad \text{(Equation A-10)}$$

$$L_{h10} = \frac{10^6}{60 \cdot n_{2m}} \left( \frac{C}{P} \right)^{\frac{10}{3}} \quad \text{(Equation A-11)}$$

**Fine Cyclo - F2C(F)**

**Fig. A-7** Distance between the individual loading points

$$l_r = x - a + l_1 \quad \text{(Equation A-4)}$$

**1. Moment stiffness**

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the input flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad \text{(Equation A-5)}$$

External bending moment  $T_k$

$$T_k = 10^{-3} \cdot (F_{R2} \cdot l_r + F_{A2} \cdot l_a) \quad \text{(Equation A-6)}$$

**2. Max. permissible bending moment and max. permissible axial load**

Check the equivalent bending moment and the equivalent axial load using equations A-6, A-7, A-8, and Fig. A-8.

Equivalent bending moment  $T_{ke}$

$$T_{ke} = 10^{-3} \cdot (C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot l_r + C_{f2} \cdot B_{f2} \cdot F_{A2} \cdot l_a) < T_{kmax} \quad \text{(Equation A-7)}$$

Equivalent axial load  $F_{A2e}$  at the output shaft

$$F_{A2e} = F_{A2} \cdot C_{f2} \cdot B_{f2} < F_{A2max} \quad \text{(Equation A-8)}$$

Size	Values of internal bearing distance	
	$l_1$ [mm]	a [mm]
A15	72.6	6.5
A25	80.4	8.7
A35	108.0	14.5
A45	139.2	20.6

**Table A-17** Bearing clearances [mm]

**Note** If:  $l_r > 4 \cdot l_1$ , please contact Sumitomo Drive Technologies.

- $F_{A2}$  = output side axial load [N]
- $F_{A2max}$  = maximum permissible output side axial load [N]
- $F_{A2e}$  = equivalent output side axial load [N]
- $F_{R2}$  = output side radial load [N]

Table A-21 Average values for moment stiffness

Fig. A-8 Max. permissible bending moment and axial load

Fine Cyclo - F3C-A

Fig. A-9 Load position output

If the output shaft is fitted with a pinion or a disc, a force acts on the shaft. The following equation is used to check whether the shaft load is permissible.

Radial load  $F_{R2}$  [kN]

$$F_{R2} = \frac{T_{2V} \cdot L_{f2} \cdot B_{f2} \cdot C_{f2}}{r_0} \leq F_{R2zul} \quad \text{(Equation A-12)}$$

Radial load

- $F_{R2zul}$  = permissible radial load [kN]
- $T_{2V}$  = equivalent output torque [Nm]
- $L_f$  = load factor
- $B_f$  = service factor
- $C_f$  = correction factor
- $r_0$  = pitch circle radius of the pinion [mm]

Correction factor output	$C_{fz}$
Chain	1
Pinion or rack	1.25
Toothed belt	1.25
V-Belt	1.5

### 5.8 Lubrication

- The gearboxes of the Fine Cyclo A-Series are filled with grease before delivery and ready to use.
- Inspection and overhaul recommended after 20,000 operating hours or 3-5 years.
- An overhaul requires experience and specialised knowledge and may only be performed by authorized specialised staff. The lifespan of the gearbox can be increased by returning it to the factory for overhauling and regreasing.

Grease prescribed	Manufacturer
CITRAX FA NO. 2	Kyodo Yushi Co., Ltd.
Conditions for use: Environmental temperature -10°C to +40°C	

Table A-26 Specified grease for the A-Series

## 5.9 Model FC-A

### 5.9.1 Assembly tolerances

In order for the thrust washer to be retained by the customer's housing, the inside diameter B must not exceed the specified values. The depth of the customer's output shaft spigot must be equal to or less than dimension D to prevent jamming the output flange. Furthermore, dimension E must be adhered to. The recommended precision of the assembly part (housing and output shaft) must lie within concentricity k and parallelism p.

The recommended diameters of the housing, output shaft, and input side flange spigots are shown schematically below.

To ensure the function, lifetime, and characteristics of the gearboxes, the radial run-out of the shaft ends, the concentricity, and the axial run-out of the fastening surface as per EN 50347:2001 are sufficient. When used in high-precision applications, the tolerance according to EN 50347:2001 should be reduced by 50%.

Size	Ø A	Ø B	Ø C	Ø Z	D	E	k	p
A15	115	90	45	85	5	15.5	0.030	0.025
A25	145	115	60	110	6	21	0.030	0.035

A65	270	226	130	210	8	33	0.030	0.065
A75	310	262	150	235	8	38	0.030	0.070

Table A-27 (Dimensions in mm)

### 5.9.2 Tightening torque and maximum permissible transmitted torque for bolts

The permissible transmitted torque for bolts and the number, size, and tightening torque for fastening the output side flange and the ring gear housing are listed in Table A-28. In the event of an emergency stop with corresponding load peaks, the output flange and ring gear housing bolts must all be replaced.

Size	Output flange bolts		Bolts for ring gear (housing)		Max. permissible transmitted torque for bolts [Nm]
	Number and size of bolts	Tightening torque [Nm]	Number and size of bolts	Tightening torque [Nm]	
A15	12 × M5	9.2	8 × M5	9.2	470
A25	12 × M6	16	8 × M6	16	830
A35	12 × M8	39	8 × M8	39	1900
A45	12 × M10	77	12 × M8	39	3550
A65	12 × M12	135	12 × M10	77	7000
A75	12 × M12	135	12 × M10	77	8000

Table A-28

- **Bolting:** Use metric hexagon socket head cap screws (DIN 4762, strength category 12.9).
- **Countermeasure for bolts loosening:** Use adhesives (Loctite 262, etc.) or spring washer (DIN 127A).
- **Use conical spring washers** (DIN 6796) when connecting the gearbox to the flange side, so that the bolt contact faces do not get damaged.

## 6 D-Series

### F4CF-D

#### Special feature:

Single stage flange gearbox with high power density and improved bearings

- Easy motor mounting with clamp ring and adapter flange
- Also obtainable as basic gearbox with hollow shaft
- 5 sizes
- Reduction ratios (single stage) 29/41/59/89/119
- Nominal output torques up to 1756 Nm
- Acceleration torques up to 3188 Nm
- Lost motion < 1 arcmin
- Excellent cost-effectiveness
- High torques
- High permissible tilting moments
- Compact design

- $T_{2N}$  = nominal output torque  
Nominal output torque corresponds to the max. permissible average load torque at all output speeds.  
The nominal output torque for speeds less than 5 min<sup>-1</sup> is equal to the value at 5 min<sup>-1</sup>.  
The value for the maximum permissible input power is calculated from the nominal output torque at 100%.  
This value takes the efficiency of Fine Cyclo into consideration.
- $n_{1max}$  = maximum permissible input speed  
However, it must be  $n_{1m}$  (mean input speed) <  $n_{1ED}$ .
- $n_{1ED}$  = permissible input speed according to load duty cycles
- $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)  
Permissible peak torque for normal start and stop procedures.
- $T_{2max}$  = max. permissible torque for emergency stop situations or in the event of heavy shocks (limited by the mechanical strength) (permissible 1000 x over the entire lifetime).
- The nominal torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N.5} \left( \frac{5}{n_{2m}} \right)^{0.3}$$

$T_{2N}$  : Nominal torque at output speed  $n_{2m}$   
 $T_{2N.5}$  : Nominal torque at output speed  $n_{2m}$  is 5 min<sup>-1</sup>

Table D-5 Torsional stiffness

$T_p$ : Test torque at input speed  $n_1 = 1500 \text{ min}^{-1}$

#### Calculation of the twist angle:

1) At a load torque less than 3%  $T_p$

$$\varphi = \frac{\text{Lost Motion}}{2} \cdot \frac{\text{Load torque}}{0.03 \cdot T_p}$$

2) At a load torque greater than 3%  $T_p$  (standard case)

$$\varphi = \frac{\text{Lost Motion}}{2} + \frac{\text{Load torque} - (0.03 \cdot T_p)}{\text{Torsional stiffness}}$$

**Note** arcmin means "angular minute".  
Table values for rigidity are average values.

### 6.4 No-load running torque NLRT

The quoted values apply to indicated standard constructions in clamp ring design.

Fig. D-1 Input side no-load running torque

- Note**
1. Fig. D-1 shows the average no-load running torque after gearbox is run in, (not factory-new condition)
  2. Table D-76 shows the measuring conditions

Ring gear housing temperature	approx. 30 °C
Precision during assembly	as per 6.8.1
Lubrication	Standard lubrication

Table D-6 Measurement conditions

### 6.5 Breakaway torque

#### Breakaway torque on output side (BTO)

- Note**
1. Table D-8 shows the max. breakaway torque on the output side BTO. Fine Cyclo reducers are not self-locking. The BTO is defined as the maximum value (factory-new condition), which steadily decreases during the lifetime.
  2. Table D-7 shows the measuring conditions

Size	Breakaway torque BTO [Nm]
D15	< 70
D25	< 100
D30	< 120
D35	< 140
D45	< 245

Table D-8 Value of the breakaway torque on the output side (BTO)

Precision during assembly	as per 6.8.1
Lubrication	Standard lubrication

Table D-7 Measurement conditions

#### Breakaway torque on input side (BTI)

- Note**
1. Table D-9 shows the max. breakaway torque BTI on the input side. The BTI is defined as the maximum value (factory-new condition) which steadily decreases during the lifetime.
  2. Table D-7 shows the measuring conditions

Size	Breakaway torque BTI [Nm]
D15	< 0.9
D25	< 1.3
D30	< 1.8
D35	< 3.0
D45	< 5.0

Table D-9 Value of the breakaway torque on the input side (BTI)

## 6.6 Efficiency

Fig. D-2 Efficiency curve

Fig. D-2 shows the correlation between efficiency and input speed. For further information see "4 Explaining the technical details" on page 18.

- Note**
1. The efficiency changes if the load torque does not match the nominal torque. Check the compensation factor in the diagram Fig. D-3.
  2. When the torque ratio is over 1.0, the compensation factor for efficiency is 1.0 (diagram Fig. D-3).

$$\text{Compensation efficiency} = \text{efficiency} \cdot \text{compensation factor}$$

Fig. D-3 Compensation curve for efficiency

$$* \text{ Torque ratio} = \frac{\text{Load torque}}{\text{Nominal output torque}}$$

## 6.7 Bearing loads

### 6.7.1 Maximum permissible radial and axial load on the input shaft

Fig. D-4

L [mm]	Load factor input $L_{f1}$				
	Size				
	D15	D25	D30	D35	D45
10	0.91	0.87			
15	0.99	0.94	0.92	0.91	
20	1.25	1.00	0.98	0.97	0.90
25	1.56	1.25	1.14	1.09	0.94
30	1.88	1.50	1.36	1.30	0.99
35	2.19	1.75	1.59	1.52	1.13

45			2.05	1.96	1.45
50				2.17	1.61
60					1.94

Table D-10 Load factor  $L_{f1}$   
L = distance from input side carrier

If the input shaft is fitted with a pinion or a disc, axial and radial forces act on the input shaft. The following equation is used to check whether the shaft load is permissible:

1. Input radial load  $F_{R1}$

$$F_{R1} = 10^3 \cdot \frac{T_{2V}}{\eta \cdot i \cdot r_0} \leq \frac{F_{R1 \max}}{L_{f1} \cdot C_{f1} \cdot B_{f1}} \quad [\text{N}] \quad (\text{Equation D-1})$$

2. Input side axial load  $F_{A1}$

$$F_{A1} \leq \frac{F_{A1 \max}}{C_{f1} \cdot B_{f1}} \quad [\text{N}] \quad (\text{Equation D-2})$$

3. When radial and axial loads co-exist

$$\left( \frac{F_{R1} \cdot L_{f1}}{F_{R1 \max}} + \frac{F_{A1}}{F_{A1 \max}} \right) \cdot C_{f1} \cdot B_{f1} \leq 1 \quad (\text{Equation D-3})$$

$F_{R1}$  = input side radial load [N]

$T_{2V}$  = equivalent output torque on output shaft [Nm]

$d_0$  = pitch circle diameter of sprocket, pinion [mm]

$F_{R1 \max}$  = maximum permissible input side radial load [N]

$F_{A1}$  = input side axial load [N]

$F_{A1 \max}$  = maximum permissible input side axial load [N]

$L_{f1}$  = load factor input (Table D-10)

$C_{f1}$  = correction factor input (Table D-11)

$B_{f1}$  = service factor input (Table D-12)

L = distance of radial force from input side carrier on gear-boxes without motor adapter (Table D-10)

$\eta$  = 0.8 (efficiency)

Correction factor input	$C_{f1}$
Chain	1
Pinion*	1.25
Toothed belt	1.25
V-Belt	1.5

Table D-11 Correction factor input  $C_{f1}$

Load conditions input	$B_{f1}$
Uniform load	1
Light impacts	1.2
Severe impacts	1.6

Table D-12 Service factor input  $B_{f1}$

Table D-13 Max. permissible input side radial load  $F_{R1 \max}$

**Calculation of the max. permissible radial load on the input shaft**

Calculation of the max. permissible radial load using the following equation when the speed is not shown in the table above.

$$F_{R1 \max} = F_{R1.600} \left( \frac{600}{n_{1m}} \right)^{1/3}$$

$F_{R1 \max}$  = maximum permissible input side radial load at input speed  $n_{1m}$

$F_{R1.600}$  = input side radial load at input speed  $n_{1m} = 600 \text{ min}^{-1}$

Table D-14 Max. permissible input side axial load  $F_{A1 \max}$

**Calculation of the max. permissible axial load on the input shaft**

Calculation of the max. permissible axial load using the following equation when the speed is not shown in the table above.

$$F_{A1 \max} = F_{A1.600} \left( \frac{600}{n_{1m}} \right)^{0.47}$$

$F_{A1 \max}$  = maximum permissible input side axial load at input speed  $n_{1m}$

$F_{A1.600}$  = input side axial load at input speed  $n_{1m} = 600 \text{ min}^{-1}$

**6.7.2 Main bearings**

Fig. D-5 Distance between the individual loading points

$$l_r = x - a + l_1 \quad \text{(Equation D-4)}$$

Size	Values of internal bearing distance	
	$l_1$ [mm]	a [mm]
D15	119	23.6
D25	139	23.4
D30	157	24.5
D35	170	40.5
D45	206	52.4

Table D-15 Bearing clearances (mm)

**Note** If:  $l_r > 4 \cdot l_1$  please contact Sumitomo Drive Technologies.

1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the input flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad \text{(Equation D-5)}$$

External bending moment  $T_k$

$$T_k = 10^{-3} \cdot (F_{R2} \cdot l_r + F_{A2} \cdot l_a) \quad \text{(Equation D-6)}$$

2. Max. permissible bending moment and max. permissible axial load

Check the equivalent bending moment and the equivalent axial load using the equations D-6, D-7, D-8 and Fig. D-6.

Equivalent bending moment  $T_{ke}$  at output

$$T_{ke} = 10^{-3} \cdot (C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot l_r + C_{f2} \cdot B_{f2} \cdot F_{A2} \cdot l_a) < T_{kmax} \quad \text{(Equation D-7)}$$

Equivalent axial load  $F_{A2e}$  at the output shaft

$$F_{A2e} = F_{A2} \cdot C_{f2} \cdot B_{f2} < F_{A2max} \quad \text{(Equation D-8)}$$

$F_{A2}$  = output side axial load [N]

$F_{A2max}$  = maximum permissible output side axial load [N]

$F_{A2e}$  = equivalent input side axial load [N]

$F_{R2}$  = output side radial load [N]

$C_{f2}$  = correction factor output (Table D-17)

$B_{f2}$  = service factor output (Table D-18)

$l_1$  = bearing clearance [mm] (Table D-15)

$l_r$  = calculated dimension for bending moment [mm]

$l_a$  = distance of axial load [mm]

$x$  = distance from radial force to flange collar [mm]

$a$  = correction factor [mm] (Table D-15)

$T_k$  = external bending moment [Nm]

$T_{kmax}$  = maximum bending moment [Nm] (Table D-19)

$T_{ke}$  = equivalent bending moment [Nm]

$\varphi_1$  = tilt angle [arcmin]

$\Theta_1$  = moment stiffness main bearing [Nm/arcmin] (Table D-16)

Size	Moment stiffness $\Theta_1$
	[Nm/arcmin]
D15	510
D25	833
D30	1127
D35	1470
D45	2450

## 6.8 Assembly specifications and tolerances

### 6.8.1 Assembly tolerances

To ensure the function, lifetime and characteristics of the gearbox, the radial run-out of the shaft ends, the concentricity, and the axial run-out of the fastening surface as per EN 50347:2001 are sufficient. When used in high-precision applications, the tolerance according to EN 50347:2001 should be reduced by 50%.

Size	Ø A	Ø B
D15	124	47
D25	145	113
D30	163	100
D35	174	75
D45	220	100

Table D-20  
(Dimensions in mm)

### 6.8.2 Tightening torque and maximum permissible transmitted torque for bolts

The permissible transmitted torque for bolts and the number, size and tightening torque for fastening the output side flange and the ring gear housing are listed in Table D-21. In the event of an emergency stop with corresponding load peaks, the output flange and ring gear housing bolts must all be replaced.

Size	Output flange bolts		Ring gear housing		Max. permissible transmitted torque for bolts [Nm]
	Number and size of bolts	Tightening torque [Nm]	Number and size of bolts	Tightening torque [Nm]	
D15	12 × M8	38.3	12 × M6	15.7	1478
D25	12 × M8	38.3	16 × M6	15.7	2065
D30	16 × M8	38.3	16 × M6	15.7	2786
D35	12 × M10	76.5	16 × M8	38.3	3962
D45	16 × M12	133	16 × M10	76.5	9347

Table D-21

- **Bolting:** Use metric hexagon socket head cap screws (DIN 4762, strength category 12.9).
- **Countermeasure for bolts loosening:** Use adhesives (Loctite 262, etc.) or spring washer (DIN 127A).
- **Use conical spring washers** (DIN 6796) when connecting the gearbox to the flange side, so that the bolt contact faces do not get damaged.

### 6.8.3 Motor mounting with clamp ring

Series D gearboxes are mounted on the motor using a clamp ring as standard.

The permissible transmittable torque and the tightening torque for the clamping screw are listed in Table D-22.

If there is no dimensional drawing for the version, or if it is not a standard version in the Series D, the required details must be obtained from Sumitomo Drive Technologies.

Motor shaft diameter [mm]	Clamping screw tightening torque [Nm]	Transmittable torque $T_1$ [Nm]
Ø9	5,5	6
Ø10	5,5	6,5
Ø11	5,5	7,5
Ø14	5,5	11
Ø16	9,5	15
Ø17	9,5	16,5
Ø19	9,5	21
Ø22	23	39
Ø24	23	49
Ø28	46	79
Ø30	46	85
Ø32	46	105
Ø38	117	269

Table D-22 Screw tightening torque and permissible drive torque values for drive shafts having a clamp ring F4CF-D

### 6.8.4 Lubrication

- For gearboxes that are not sealed, delivery does not include lubricant (grease filling). Upon receipt, the customer must therefore fill it with the appropriate amount (Table D-24) of the recommended grease (Table D-23).
- Use the quantity quoted in Table D-24 as a guideline value; check the grease level.
- Fit the lubrication port and the grease drain on the output side. (See "A" and Table D-24)
- When filling grease for the first time use the bottom hole in order to ensure grease circulation.
- Inspection and overhaul recommended after 20,000 operating hours or 3-5 years.
- An overhaul requires experience and specialised knowledge and must only be performed by authorised specialised staff. The lifespan of the gearbox can be increased by returning it to the factory for overhauling and regreasing.

Grease prescribed	Manufacturer
Multemp FZ No. 00	Kyodo Yushi Co., Ltd.
Conditions for use: Environmental temperature -10°C to +40°C	

Table D-23 Specified grease

## 7 C-Series

F4C(F)-C

F2CF-C

### Special feature:

The large diameter of the hollow shaft allows effective use of space for cables or pipelines

- 6 sizes
- Reduction ratios (single stage) 29/59/89/119
- Nominal output torques up to 4328 Nm
- Acceleration torques up to 6278 Nm
- Hollow shaft diameter from 40 to 99 mm
- Completely sealed and maintenance-free
- Lost Motion < 1

1.  $T_{2N}$  = nominal output torque  
Nominal output torque corresponds to the max. permissible average load torque at all output speeds.  
The nominal output torque for speeds less than  $5 \text{ min}^{-1}$  is equal to the value at  $5 \text{ min}^{-1}$ .  
The value for the maximum permissible input power is calculated from the nominal output torque at 100%.  
This value takes the efficiency of Fine Cyclo into consideration.
2.  $n_{1max}$  = maximum permissible input speed  
However, it must be  $n_{1m}$  (mean input speed)  $< n_{1ED}$ .
3.  $n_{1ED}$  = permissible input speed according to load duty cycles
4.  $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)  
Permissible peak torque for normal start and stop procedures.
5.  $T_{2max}$  = max. permissible torque for emergency stop situations or in the event of heavy shocks (limited by the mechanical strength)  
(permissible 1000 times during the entire lifetime).
6. The nominal torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N.5} \left( \frac{5}{n_{2m}} \right)^{0.3}$$

$T_{2N}$  : Nominal torque at output speed  $n_{2m}$   
 $T_{2N.5}$  : Nominal torque at output speed  $n_{2m}$  is  $5 \text{ min}^{-1}$

Table C-5 Torsional stiffness

$T_p$ : Test torque at input speed  $n_1 = 1750 \text{ min}^{-1}$

#### Calculation of the twist angle:

1) At a load torque less than 3%  $T_p$

$$\varphi = \frac{\text{Lost Motion}}{2} \cdot \frac{\text{Load torque}}{0.03 \cdot T_p}$$

2) At a load torque greater than 3%  $T_p$  (standard case)

$$\varphi = \frac{\text{Lost Motion}}{2} + \frac{\text{Load torque} - (0.03 \cdot T_p)}{\text{Torsional stiffness}}$$

**Note** arcmin means "angular minute".  
Table values for rigidity are average values.

### 7.4 No-load running torque NLRT

Fig. C-1 Input side no-load running torque

**Note**

1. Fig. C-1 shows the average no-load running torque after gearbox is run in (not factory-new condition).
2. Table C-6 shows the measuring conditions

Ring gear housing temperature	approx. 30°C
Precision during assembly	as per 7.8.1
Lubrication	Standard lubrication

Table C-6 Measurement conditions

### 7.5 Breakaway torque

Indicates the necessary torque for breakaway of the gearbox on the input or output side, after stop without output side load.

#### Breakaway torque on output side (BTO)

- Note**
1. Table C-8 shows the max. breakaway torque on the output side BTO. Fine Cyclo reducers are not self-locking. The BTO is defined as the maximum value (factory-new condition), which steadily decreases during the lifetime.
  2. Table C-7 shows the measuring conditions

Precision during assembly	as per 7.8.1
Lubrication	Standard lubrication

Table C-7 Measurement conditions

Size	i	Breakaway torque BTO [Nm]
C15	29	< 70
	59	< 70
	89	< 128
	119	< 128
C25	59	< 200
	89	< 220
	119	< 240
C35	59	< 300
	89	< 415
	119	< 550
C45	59	< 340
	89	< 550
	119	< 715
C55	59	< 600
	89	< 810
	119	< 1000
C65	59	< 700
	89	< 1000
	119	< 2100

Table C-8 Value of the breakaway torque on the output side (BTO)

#### Breakaway torque on input side (BTI)

- Note**
1. Table C-9 shows the max. breakaway torque BTI on the input side. The BTI is defined as the maximum value (factory-new condition) which steadily decreases during the lifetime.
  2. Table C-7 shows the measuring conditions

Size	Breakaway torque BTI [Nm]
C15	< 2.4
C25	< 3.5
C35	< 4.5
C45	< 6.5
C55	< 9.0
C65	< 11.5

Table C-9 Value of the breakaway torque on the input side (BTI)

## 7.6 Efficiency

Fig. C-2a Efficiency curve (size C15-C45)

Fig. C-2b Efficiency curve (size C55-C65)

Fig. C-2a and Fig. C-2b show the correlation between efficiency and input speed Further information see "4 Explaining the technical details" on page 18.

Fig. C-3 Compensation curve for efficiency

**Compensation efficiency =  
efficiency · compensation factor**

**Note**

1. The efficiency changes if the load torque does not match the nominal torque. Check the compensation factor in the diagram Fig. C-3.
2. When the torque ratio is over 1.0, the compensation factor for efficiency is 1.0 (Diagram Fig. C-3).

\* Torque ratio =  $\frac{\text{Load torque}}{\text{Nominal output torque}}$

## 7.7 Bearing loads

### 7.7.1 Maximum permissible radial and axial load on the input shaft

Fig. C-4 Load position on input shaft

L [mm]	Load factor input $L_{fi}$					
	Size					
	C15	C25	C35	C45	C55	C65
5	0.79	0.8	0.76	0.75	0.73	0.73
10	0.86	0.86	0.81	0.79	0.77	0.77
15	0.93	0.92	0.86	0.83	0.8	0.8
20	1	0.98	0.9	0.87	0.84	0.84
25	1.25	1.14	0.95	0.91	0.88	0.87
30	1.5	1.36	1	0.95	0.91	0.9
35	1.75	1.59	1.17	0.99	0.95	0.94
40	2	1.82	1.33	1.11	0.99	0.97
45	2.25	2.05	1.5	1.25	1.07	1.02
50	2.5	2.27	1.67	1.39	1.19	1.14
60	3	2.73	2	1.67	1.43	1.36
70				1.94	1.67	1.59
80					1.9	1.82

Table C-10 Load factor input  $L_{fi}$   
L = distance from input side carrier

If a pinion or toothed belt pulley is mounted on the input shaft, the values for radial load and axial load should be equal to or less than the permissible values. The following equation is used to check whether the shaft load is permissible:

1. Input radial load  $F_{R1}$

$$F_{R1} = 10^3 \cdot \frac{T_{2V}}{\eta \cdot i \cdot r_0} \leq \frac{F_{R1 \max}}{L_{fi} \cdot C_{fi} \cdot B_{fi}} \quad [\text{N}] \quad (\text{Equation C-1})$$

2. Input side axial load  $F_{A1}$

$$F_{A1} \leq \frac{F_{A1 \max}}{C_{fi} \cdot B_{fi}} \quad [\text{N}] \quad (\text{Equation C-2})$$

3. When radial and axial loads co-exist

$$\left( \frac{F_{R1} \cdot L_{fi}}{F_{R1 \max}} + \frac{F_{A1}}{F_{A1 \max}} \right) \cdot C_{fi} \cdot B_{fi} \leq 1 \quad (\text{Equation C-3})$$

$F_{R1}$  = input side radial load [N]

$T_{2V}$  = equivalent output torque on output shaft [Nm]

$r_0$  = pitch circle radius of sprocket, pinion or toothed belt pulley [mm]

$F_{R1 \max}$  = maximum permissible input side radial load [N] (Table C-11)

$F_{A1}$  = input side axial load [N]

$F_{A1 \max}$  = maximum permissible input side axial load [N] (Table C-12)

$L_{fi}$  = load factor input (Table C-10)

$C_{fi}$  = correction factor input (Table C-13)

$B_{fi}$  = service factor input (Table C-14)

L = distance of the radial load from the input side carrier (Table C-10)

$\eta$  = 0.7 (efficiency)

Size	Input speed $n_{1m}$ [min <sup>-1</sup> ]						
	2500	2000	1750	1500	1000	750	600

Table C-12 Max. permissible input side axial load  $F_{A1\max}$  [N]

**Calculation of the max. permissible radial load on the input shaft**

Calculation of the max. permissible radial load using the following equation when the speed is not shown in the table above.

$$F_{R1\max} = F_{R1.600} \left( \frac{600}{n_{1m}} \right)^{1/3}$$

$F_{R1\max}$  = maximum permissible input side radial load at input speed  $n_{1m}$

$F_{R1.600}$  = input side radial load at input speed  $n_{1m} = 600 \text{ min}^{-1}$

Correction factor input	$C_{fi}$
Chain	1
Pinion*	1.25
Toothed belt	1.25
V-Belt	1.5

Table C-13 Correction factor input  $C_{fi}$

\* For helical pinions or bevel gears, please consult Sumitomo Drive Technologies.

**Calculation of the max. permissible axial load on the input shaft**

Calculation of the max. permissible axial load using the following equation when the speed is not shown in the table above.

$$F_{A1\max} = F_{A1.600} \left( \frac{600}{n_{1m}} \right)^{0.47}$$

$F_{A1\max}$  = maximum permissible input side axial load at input speed  $n_{1m}$

$F_{A1.600}$  = input side axial load at input speed  $n_{1m} = 600 \text{ min}^{-1}$

Service factor input	$B_{fi}$
Uniform load	1
Light impacts	1.2
Severe impacts	1.6

Table C-14 Service factor input  $B_{fi}$

### 7.7.2 Main bearings

Fig. C-5 Distance between the individual loading points

$$l_r = x - a + l_1 \quad \text{(Equation C-4)}$$

1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the input flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad \text{(Equation C-5)}$$

External bending moment  $T_k$

$$T_k = 10^{-3} \cdot (F_{R2} \cdot l_r + F_{A2} \cdot l_a) \quad \text{(Equation C-6)}$$

2. Max. permissible bending moment and max. permissible axial load

Check the external bending moment and the external axial load using equations C-6, C-7 and C-8.

Equivalent bending moment  $T_{ke}$

$$T_{ke} = 10^{-3} \cdot (C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot l_r + C_{f2} \cdot B_{f2} \cdot F_{A2} \cdot l_a) < T_{k \max} \quad \text{(Equation C-7)}$$

Equivalent axial load  $F_{A2e}$  at the output shaft

$$F_{A2e} = F_{A2} \cdot C_{f2} \cdot B_{f2} < F_{A2 \max} \quad \text{(Equation C-8)}$$

Size	Values of internal bearing distance	
	$l_1$ [mm]	a [mm]

## 7.8 Assembly specifications and tolerances

### 7.8.1 Assembly tolerances

Fittings for assembly of input and output parts (toothed belt, disc, pinion, etc.) are shown schematically in the following figure. Use the diameters and tolerances shown in the table below.

Size	Ø A	Ø B	Ø Z	Ø Y
C15	137	71 h7	137	49.5
C25	185	133 H7	185	59
C35	220	167 H7	220	79
C45	250	192 H7	250	94
C55	284	218 H7	284	109
C65	320	245 H7	320	119

Table C-20 (Dimensions in mm)

### 7.8.2 Assembly procedure

(1)

The Fine Cyclo C-Series is attached to the machine casing by bolts. (spigot Z)  
The opposite side (spigot A) can also be used for attachment to a machine housing when installed into the machine.

(2)

Use bolts to attach the toothed belt pulley or equivalent parts to the input shaft.

(3)

Use bolts to attach output flange of Fine Cyclo to output shaft of machine. (spigot B)

**Note!**

1. Make sure that you use the correct tightening torque for all fastening bolts when attaching the gearbox (see Table C-21).
2. Use bolts that are shorter than the depth of the threaded holes in the dimensioned drawing of the output flange.

### 7.8.3 Tightening torque and maximum permissible transmitted torque for bolts

The permissible transmitted torque for bolts and the number, size and tightening torque for fastening the output side flange and the ring gear housing are listed in Table C-21. In the event of an emergency stop with corresponding load peaks, the output flange and ring gear housing bolts must all be replaced.

Size	Output flange bolts			Bolts for ring gear (housing)		
	Number and size of bolts	Tightening torque [Nm]	Max. permissible transmitted torque for bolts [Nm]	Number and size of bolts	Tightening torque [Nm]	Max. permissible transmitted torque for bolts [Nm]
C15	16 × M6	13.6	1252	12 × M6	13.6	1520
C25	12 × M8	33.4	2080	12 × M8	33.4	3178
C35	12 × M10	65.7	4267	8 × M10	65.7	4670
C45	12 × M12	114	7191	8 × M12	114	7760
C55	12 × M14	181	10919	12 × M12	114	13008
C65	12 × M16	284	16893	16 × M12	114	19404

Size	Eccentric high speed shaft		
	Number and size of bolts	Tightening torque [Nm]	Max. permissible transmitted torque for bolts [Nm]
C15	6 × M3	1.67	57
C25	6 × M3	1.67	69
C35	6 × M4	3.92	157
C45	6 × M4	3.92	196
C55	8 × M5	8.04	481
C65	12 × M5	8.04	785

Table C-21

- **Bolting:** Use metric hexagon socket head cap screws (DIN 4762, strength category 10.9).
- **Countermeasure for bolts loosening:** Use adhesives (Loctite 262, etc.) or spring washer (DIN 127A).
- **Use conical spring washers** (DIN 6796) when connecting the gearbox to the flange side, so that the bolt contact faces do not get damaged.

### 7.8.4 Lubrication

- The gearboxes of the Fine Cyclo C-Series are filled with grease before delivery and are ready to use.
- Inspection and overhaul recommended after 20,000 operating hours or 3-5 years.
- An overhaul requires experience and specialised knowledge and may only be performed by authorized specialised staff. The lifespan of the gearbox can be increased by returning it to the factory for overhauling and regreasing.

Grease prescribed	Manufacturer
Multemp FZ No. 00	Kyodo Yushi Co., Ltd.
Conditions for use: Environmental temperature -10 °C to +40 °C

## 8 T-Series

### F2C(F)-T

#### Special feature:

Gearboxes with high positioning and path accuracy, even under highly fluctuating dynamic conditions

- 7 sizes
- Integral spur wheel pre-stage
- Low moments of inertia
- Reduction ratios (double stage) 81/118.5/141/171
- Nominal output torques up to 6140 Nm
- Acceleration torques up to 11000 Nm
- Input speeds up to 8460 min<sup>-1</sup>
- Lost motion < 0.5 arcmin
- Very smooth running
- High efficiency, even at low speeds
- Low vibration

- $T_{2N}$  = nominal output torque

Nominal output torque corresponds to the max. permissible average load torque at all output speeds.  
 The nominal output torque for speeds less than 5 min<sup>-1</sup> is equal to the value at 5 min<sup>-1</sup>.  
 The value for the maximum permissible input power is calculated from the nominal output torque at 100%.  
 This value takes the efficiency of Fine Cyclo into consideration.
- $n_{1\max}$  = maximum permissible input speed

Gearbox can be used in the maximum input speed range specified in the table.
- $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)

Permissible peak torque for normal start and stop procedures.
- $T_{2\max}$  = max. permissible torque for emergency stop situations or in the event of heavy shocks (limited by the mechanical strength)  
 (permissible 1000 x over the entire lifetime).
- The nominal torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N,15} \left( \frac{15}{n_{2m}} \right)^{0,3}$$

$T_{2N}$  : Nominal torque at output speed  $n_{2m}$   
 $T_{2N,15}$  : Nominal torque at output speed  $n_{2m}$  is 15 min<sup>-1</sup>

- $T_{2N}$  = nominal output torque  
Nominal output torque corresponds to the max. permissible average load torque at all input speeds.  
The nominal output torque for speeds  $n_2$  less than 5 min<sup>-1</sup> is equal to the value at 5 min<sup>-1</sup>.  
The value for the maximum permissible input power is calculated from the nominal output torque at 100%.  
This value takes the efficiency of Fine Cyclo into consideration.
- $n_{1\max}$  = maximum permissible input speed  
Gearbox can be used in the maximum input speed range specified in the table.
- $T_{2A}$  = max. acceleration and braking torque (for fatigue strength at  $2 \cdot 10^7$  load cycles)  
Permissible peak torque for normal start and stop procedures.
- $T_{2\max}$  = max. permissible torque for emergency stop situations or in the event of heavy shocks (limited by the mechanical strength)  
(permissible 1000 x over the entire lifetime).
- The nominal torque  $T_{2N}$  is calculated using the following equation when the speed is not shown in the table above:

$$T_{2N} = T_{2N,600} \cdot \left( \frac{600}{n_{1m}} \right)^{0.3}$$

$T_{2N}$  : Rated torque at input speed  $n_{1m}$   
 $T_{2N,600}$  : Rated torque at input speed  $n_{1m}$  is 600 min<sup>-1</sup>

Table T-5 Torsional stiffness

$T_p$ : Test torque at input speed  $n_i = 1500 \text{ min}^{-1}$

#### Calculation of the twist angle:

1) At a load torque less than 3%  $T_p$

$$\varphi = \frac{\text{Lost Motion}}{2} \cdot \frac{\text{Load torque}}{0.03 \cdot T_p}$$

2) At a load torque greater than 3%  $T_p$  (standard case)

$$\varphi = \frac{\text{Lost Motion}}{2} + \frac{\text{Load torque} - (0.03 \cdot T_p)}{\text{Torsional stiffness}}$$

**Note** arcmin means "angular minute".  
Table values for rigidity are average values.

### 8.4 No-load running torque NLRT

Fig. T-1 Input side no-load running torque

**Note**

- Fig. T-1 shows the average no-load running torque after gearbox is run in (not factory-new condition).
- Table T-6 shows the measuring conditions

Ring gear housing temperature	approx. 30°C
Precision during assembly	as per 8.8.1
Lubrication	Standard lubrication

Table T-6 Measurement conditions

## 8.5 Breakaway torque

Indicates the necessary torque for breakaway of the gearbox on the input or output side, after stop without output side load.

### Breakaway torque on output side (BTO)

- Note**
1. Table T-8 shows the max. breakaway torque on the output side BTO. Fine Cyclo reducers are not self-locking. The BTO is defined as the maximum value (factory-new condition), which steadily decreases during the lifetime.
  2. Table T-7 shows the measuring conditions

Precision during assembly	as per 8.8.1
Lubrication	Standard lubrication

Table T-7 Measurement conditions

Size	Breakaway torque BTO [Nm]

Table T-9 Value of the breakaway torque on the input side (BTI)

## 8.6 Efficiency

Fig. T-2a Efficiency curve

Fig. T-2b Efficiency curve at low speeds

The Fig. T-2a and Fig. T-2b show the efficiency of a run-in gearbox under nominal load at an ambient temperature of 20°. For further information see "4 Explaining the technical details" on page 18.

Fig. T-3 Compensation curve for efficiency

**Compensation efficiency =  
efficiency · compensation factor**

**Note**

1. The efficiency changes if the load torque does not match the nominal torque. Check the compensation factor in the diagram Fig. T-3.
2. When the torque ratio is over 1.0, the compensation factor for efficiency is 1.0 (diagram Fig. T-3).

$$* \text{Torque ratio} = \frac{\text{Load torque}}{\text{Nominal output torque}}$$

### 8.7 Main bearings

Fig. T-4 Distance between the individual loading points

$$l_r = x - a + l_1 \quad \text{(Equation T-4)}$$

1. Moment stiffness

The moment stiffness is the bending moment at which the output flange is tilted by the tilt angle.

The tilt angle of the input flange is determined as follows:

$$\varphi_1 = \frac{T_k}{\Theta_1} \quad \text{(Equation T-5)}$$

External bending moment  $T_k$

$$T_k = 10^{-3} \cdot (F_{R2} \cdot l_r + F_{A2} \cdot l_a) \quad \text{(Equation T-6)}$$

2. Max. permissible bending moment and max. permissible axial load

Check the external bending moment and the external axial load using equations T-6, T-7, T-8 and Fig. T-14.

Equivalent bending moment  $T_{ke}$

$$T_{ke} = 10^{-3} \cdot (C_{f2} \cdot B_{f2} \cdot F_{R2} \cdot l_r + C_{f2} \cdot B_{f2} \cdot F_{A2} \cdot l_a) < T_{k \max} \quad \text{(Equation T-7)}$$

Equivalent axial load  $F_{A2e}$  at the output shaft

$$F_{A2e} = F_{A2} \cdot C_{f2} \cdot B_{f2} < F_{A2 \max} \quad \text{(Equation T-8)}$$

Size	Moment stiffness $\Theta_1$
	[Nm/arcmin]

## 8.8 Assembly specifications and tolerances

### 8.8.1 Assembly tolerances

To ensure the function, lifetime, and characteristics of the gearboxes, the radial run-out of the shaft ends, the concentricity and the axial run-out of the fastening flange as per EN 50347:2001 are sufficient. When used in high-precision applications, the tolerance according to EN 50347:2001 should be reduced by 50%.

Size	$\varnothing A$	$\varnothing B$	$\varnothing Z$	$\varnothing k$
T155	125	23.5	125	0.030
T255	155	28	155	
T355	185	35	185	
T455	230	42	230	
T555	260	47	260	0.050
T655	295	58	295	
T755	330	62	330	

Table T-15 (Dimensions in mm)

### Tightening torque and maximum permissible transmitted torque for bolts

The permissible transmitted torque for bolts and the number, size and tightening torque for fastening the output side flange and the ring gear housing are listed in Table T-16. In the event of an emergency stop with corresponding load peaks, the output flange and ring gear housing bolts must all be replaced. Liquid sealing material must be applied between all fittings of the gearbox with the customer's applications.

Size	Output flange bolts				Bolts for ring gear (housing)		
	Number and size of bolts	Pitch circle- $\emptyset$	Tightening torque [Nm]	Max. permissible transmitted torque for bolts [Nm]	Number and size of bolts	Tightening torque [Nm]	Max. permissible transmitted torque for bolts [Nm]

	3 × M16	170	280				
	6 × M16	115	280				
T755	6 × M24	200	950	24000	16 × M16 (24 × M12)*	280 (115)*	27000 (24300)*
	3 × M18	190	390				
	6 × M18	130	390				

Table T-16

\* Values in brackets apply only for type F2CF-T

- **Bolting:** Use metric hexagon socket head cap screws (DIN 4762, strength category 10.9).
- **Countermeasure for bolts loosening:** Use adhesives (Loctite 262, etc.) or spring washer (DIN 127A).
- **Use conical spring washers** (DIN 6796) when connecting the gearbox to the flange side, so that the bolt contact faces do not get damaged.

### 8.8.2 Installation example

An adapter is required for the installation of the motor on the input side flange. This can be supplied. An radial shaft seal must be provided in this adapter. The input shaft of the gearbox is not mounted in the gearbox.

The customer's output shaft is bolted to the output flange of the gearbox.

In the case of standard installations with a hollow shaft and keyway, the input shaft of the gearbox must be screwed to the front threaded hole of the motor shaft. The motor shaft must have a key. The correct insertion depth of the spline (shaft distance from output) must be observed as per the Fine Cyclo catalogue (see the dimension sheets).

### 8.8.3 Lubrication

- Fine Cyclo Type F2C(F)-T gearboxes are delivered without grease and must first be filled with Multemp FZ No. 00 grease (Table T-16), and sealed before commissioning (lubrication port see figure). These greases are suitable for ambient temperatures from -10°C to +40°C.
- After the described grease filling, the gearboxes are maintenance-free.

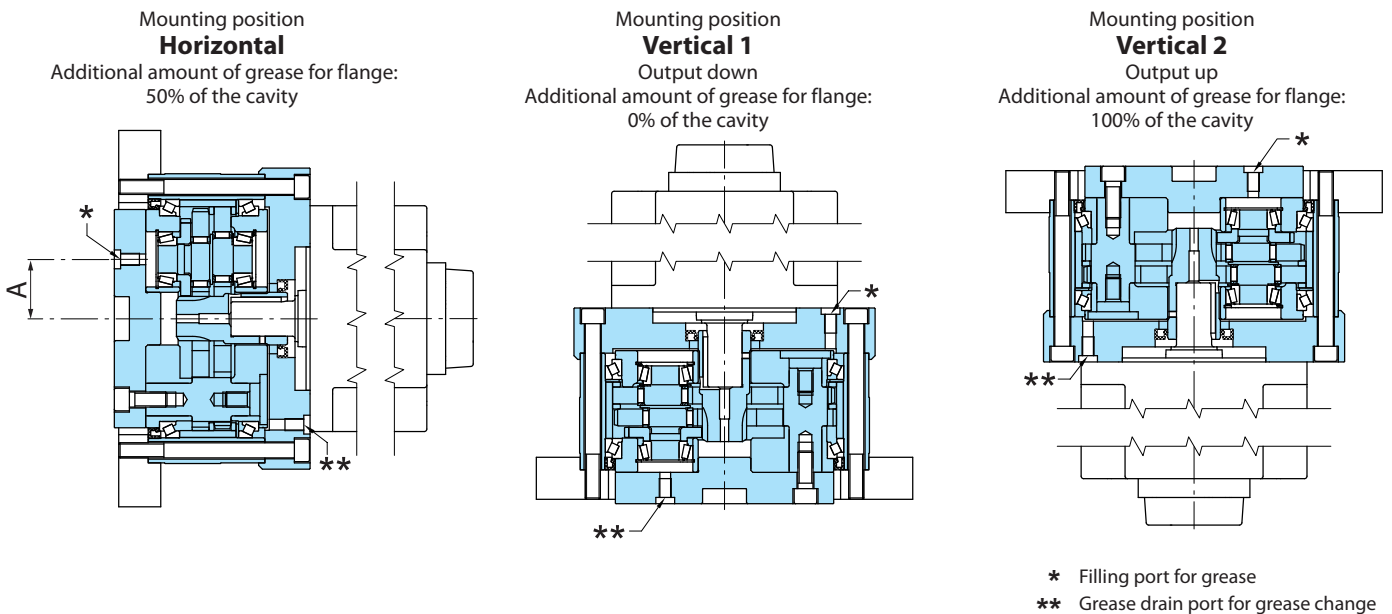

Size	Quantity of grease [g]		A [mm]
	Vertical	Horizontal	
T155	80	60	25
T255	120	100	31
T355	230	180	39
T455	300	240	47
T555	400	320	55
T655	700	560	63
T755	800	640	73

Table T-18 Lubrication

The grease quantity above relates to the gearbox. The cavity between the gearbox and the motor (intermediate flange) must also be taken into account.

Grease prescribed	Manufacturer
Multemp FZ No. 00	Kyodo Yushi Co., Ltd.
Conditions for use: Environmental temperature -10°C to +40°C	

Table T-17 Specified grease for the T-Series

### Determination of the cavity

The additional amount of grease is necessary for the functioning of the gearbox

# 9 Appendix

## Precision gearbox - application data sheet

Specific application data is required for the selection of a suitable precision gearbox.  
Please complete the following data sheet to enable us to respond quickly. Thank you.

### 1. Load cycle:

	<p><math>t_A</math> = acceleration time  <math>t_R</math> = duration of uniform movement  <math>t_B</math> = braking time (deceleration time)  <math>t_P</math> = off-time (time between movements)  <math>t_M</math> = duration of the movement phase of a working cycle (<math>t_A + t_R + t_B</math>)  <math>t_C</math> = duration of the entire working cycle (<math>t_M + t_P</math>)</p>
	<p><math>T_A</math> = torque when starting (acceleration torque)  <math>T_R</math> = torque at constant speed  <math>T_B</math> = brake torque (deceleration torque)  <math>T_P</math> = pause torque (to hold the position between the movements if necessary)</p>

Precision gearbox - application data sheet

2. For how many hours a day is the application in operation? \_\_\_\_\_

3. What is the required reduction ratio? \_\_\_\_\_ : 1

4. Please specify the following input power data (motor):

1. Nominal speed: \_\_\_\_\_ [min<sup>-1</sup>]

2. Continuous static torque: \_\_\_\_\_ [Nm]

3. Peak torque: \_\_\_\_\_ [Nm]

4. Manufacturer: \_\_\_\_\_

5. Model number: \_\_\_\_\_

5. Shall Sumitomo provide an input adapter?

yes

no

If you have selected "Yes", please specify the dimensions of the input or submit a copy of the dimensioned drawing.

Is it a motor shaft with or without a key?

With key

Without key

6. How is the gearbox connected to the final load?

Direct coupling

Toothed belt or sprocket drive (go to number 8 on the next page)

V-belt (go to number 8 on the next page)

Toothed gearbox or other gearbox (go to number 8 on the next page)

Other (go to number 8 on the next page)

7. Please select one of the following load properties:

Uniform load

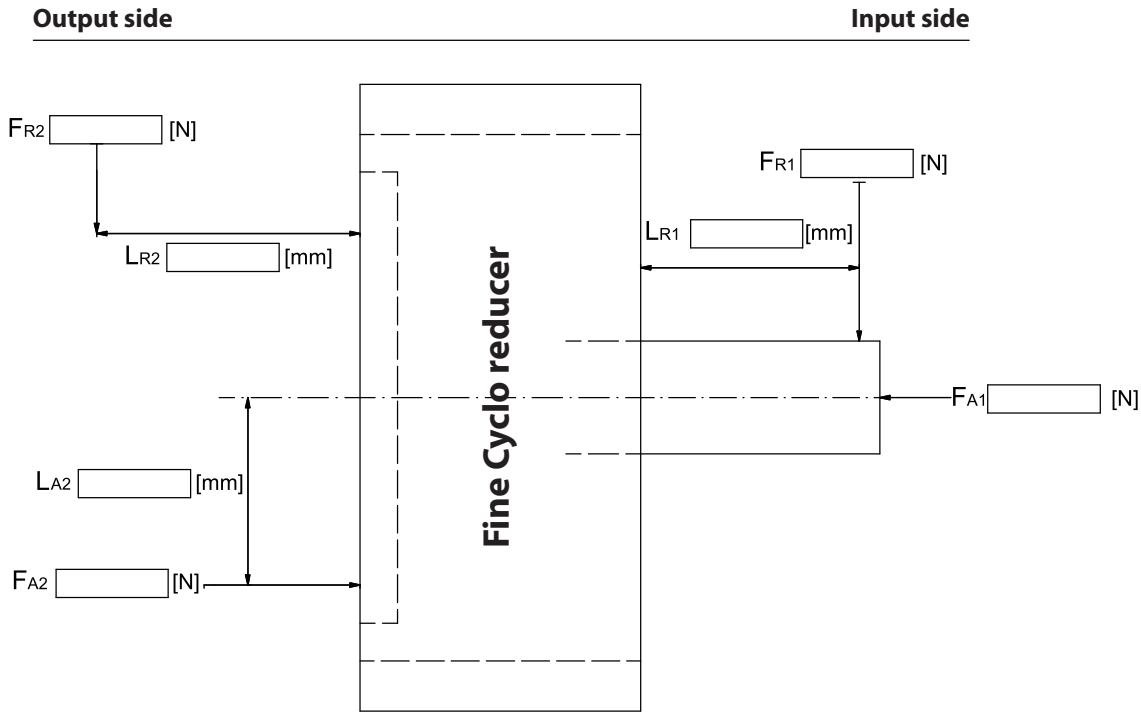

Moderate impact load

Heavy impact load

**8. Radial and axial load**

Is there a radial and/or axial load on the output flange?

- yes
- no

$F_R$  = radial load  
 $L_R$  = distance from radial force to flange collar  
 $F_A$  = axial load  
 $L_A$  = distance of the axial load from the centre line  
 1: Input side  
 2: Output side

**9. Please describe your application in as much detail as possible (if possible, please enclose drawing).**
